

Data Center Overview

Business Catalyst has three active data centers around the world. In the U.S., we are collocated at a Switch and Data (NASDAQ: SDXC) facility. In Europe, we utilize a Data Electronics facility, and in Australasia we utilize facilities managed by Access Networks.

These data centers are some of the best on offer within the hosting industry. They offer redundant power supplies, multiple layers of physical and operational security, fire protection services and dedicated on-site professionals 24x7 - all aimed at maintaining the integrity and performance of customers' needs.

We own and manage our own state-of-the-art hardware infrastructure within each data center in order to provide high-quality service to all customers.

dedicated, redundant multi-gigabit connections to top-tier Internet Service Providers

multiple redundant application servers with isolated functions for reporting, DNS, email campaigns, & other services

horizontal scaling across many enterprise-grade Hewlett Packard web servers

Juniper NetScreen® firewalls with multi-gigabit throughput

NetApp Storage Area Networks with redundant disks & control units for data security

carrier-grade Cisco Catalyst® switches

multiple mirrored SQL databases with instant failover to standby servers

f5 BigIP load balancers & SSL accelerators for high availability & performance
